Computer Science graduate doing **IT support** for **Windows** and **Mac** devices: **Jira** tickets, remote **SSH** sessions, and hardware and software updates. Skilled with **Windows** and **macOS**, **Ghost**, **MDT**, and **SCCM**, vendor diagnostics, and **quality control** on **Tier One** hardware (**HP**, **IBM**, **Toshiba**, **Compaq**). Experienced supporting end users through break/fix, messaging and server software setup, **LAN/WAN** checks, and basic scripting from work instructions.

Technical Skills

Hardware & Operating Systems: Windows, macOS, Linux, Ubuntu, RHEL, CentOS, Arch, Raspberry Pi, desktops, laptops, mobile devices, servers, peripherals, HP, IBM, Toshiba, Compaq

Imaging & Deployment: Ghost, MDT, SCCM, work instructions, software customization, vendor diagnostics

Support & Applications: Desktop support, break/fix, customer support, Jira, SSH, Outlook, Teams, remote access, patching

Warehouse & Quality: Receiving, staging, asset tagging, kitting, inventory, shipping, quality control inspections

Networking & Automation: LAN/WAN, basic scripting, ticket updates, vendor websites, driver and firmware updates

Experience

IT Support Engineer, Hybrid, **Labs196**, TX — Feb 2025 to Present

- Owned the **break/fix** queue in **Jira**, triaged incoming device tickets by impact, and carried each one from first response through troubleshooting to close, with the resolution written in the ticket before it left the queue and the user was told.
- Worked with the user who opened the ticket, reproduced the failure on their **Windows** or **Mac**, and stayed on the session until the machine was usable again and the same issue did not return on the next login once the **patch** was applied.
- Used **SSH** and remote access to take the user's machine, fixed OS, application, and login failures on the live **Windows** or **Mac**, and handed it back only after they could sign in and finish the task that had failed earlier that day.
- Kept **Windows** and **macOS** desktops and laptops current with **drivers**, OS **patches**, and application upgrades, then retested the machine and closed the ticket once the user confirmed the app opened for them and sign-in still worked.
- Replaced failed peripherals and drives, installed requested software, and recorded the parts and changes in **Jira** so the next engineer could see what was done on that **Windows** or **Mac** during the support visit and which part was swapped.

IT Services Technician, On-Site, **CDW**, GA — Jan 2024 to Jan 2025

- Imaged **Windows** systems with **Ghost** and **MDT** and installed the customer's software, including messaging clients, from work instructions, then checked the image, drivers, and login before the unit moved on to quality control.
- Diagnosed hardware faults on **HP**, **IBM**, **Toshiba**, and **Compaq** systems and used vendor sites for driver and firmware updates, then applied the matching package and retested the device on the bench before it shipped.
- Ran **quality control** on completed configuration builds and sent failed units back for rework before the order was released.
- Pulled stock for the customer order, built the system, asset-tagged it, and staged the finished unit for shipment.
- Gave break/fix support on **Windows** PCs and basic server software during configuration, confirmed **LAN** connectivity, and logged the repair and parts on the order before it shipped.

Projects

Self-Hosted Private Cloud — Personal Project

- Designed a private cloud on a custom server rack and replaced paid streaming and cloud storage with self-hosted **Jellyfin**, **Immich**, and **Nextcloud** for media, photos, and files on the home network.
- Wrote Infrastructure-as-Script pipelines (**deploy.sh** and per-service scripts) for **Docker Compose**, **PM2**, **nginx**, and **Certbot** so one command deploys the stack with **HTTPS**, on ports **9000** to **9999**, and again at boot with **systemd**.
- Run the host on **Arch Linux** with an **Intel Core i7-14700HX**, **32 GB** RAM, an **NVIDIA RTX 4070**, and a **1 TB** NVMe, and keep Jellyfin, Immich, and Nextcloud data on a **2 TB** disk.
- Built tiered storage on that data disk with **rsync** migration, and mirrored about **735 GB** to a backup drive every day at 4 AM with a **systemd** timer so a disk failure would not take the library.
- Built a **FastAPI** dashboard on **PM2** for **10+** projects, with process, **Docker**, port, and **HTTPS** checks plus one-click restart, proxied **TinyPilot** and **OctoPi** through **nginx**, and run a **kind** lab for Deployments, Services, Secrets, and Ingress.

Education

State University of New York at Binghamton — Aug 2022 to Dec 2023
Master of Science in Computer Science — 3.4/4.00 GPA

Universal College of Engineering, Mumbai — 2017 to Aug 2021
Bachelor of Engineering in Computer Engineering — CGPA 8.09/10
